CLAIMS

- 1. A method for time-synchronization of at least two radio access modules of a multimode communication terminal capable to function according to at least two distinct radio access technique in a cellular telecommunication network in which one of said radio access modules is active in a current cell and the other radio access module is in a passive state in said current cell, said method comprising steps of:
- (a) measuring for each of cells adjacent to the current cell a time offset T_{offset} between start of a specific frame of the first radio technique and start of a specific frame of the second radio access technique; and
- (b) using the time offset T_{offset} measured in step (a) for synchronizing the passive radio access module with the active radio access module.
- 2. The method according to claim 1, further comprising a step of activating the passive radio module from the active radio access module.
- 3. The method according to claim 1 or 2, comprising a step of updating a value of the offset T_{offset} on each change of the current cell and for each neighboring cell associated with the radio access technique of the passive module.
- 4. The method according to any one of claims 1 to 3, wherein the mobile terminal is a UMTS/GSM dual-mode terminal and wherein the predefined duration T_{offset} is a time difference observed on GSM defined in standard 3GPP TS 25.215.
- 5. The method according to claim 2, wherein the activation of the passive access module is made immediately before the measurements on cells adjacent to the current cell.
- 6. A device for time-synchronizing at least two radio access modules of a multimode communication terminal capable to function according to at least two distinct radio access techniques in a cellular telecommunication network in which

one of said radio access modules is active in a current cell and the other radio access module is in a passive state in said current cell, said device comprising:

means for measuring a time offset T_{offset} between start of a specific frame of the first radio technique and start of a specific frame of the second radio access technique; and

means for synchronizing the passive radio access module with the active radio access module using the tine offset T_{offset} .

7. A multimode mobile terminal comprising:

a radio access module dedicated to each operating mode;

a clock generator associated with each radio access module; and

a unit for calculating a time offset T_{offset} between start of a specific frame of a first operating mode and start of a specific frame of a second operating mode in a cellular telecommunication network,

wherein said mobile terminal comprises a central interface capable to generate a clock signal of a passive radio access module shifted with respect to a clock signal of an active radio access module concerning said duration T_{offset} .

- 8. The mobile terminal according to claim 7, wherein said central interface comprises a module for generating an order for activating the passive radio access module.
- 9. The mobile terminal according to claim 7 or 8, wherein said mobile terminal supports a UMTS network and a GSM network.
